ORGANIZATION OF BULLETIN NO. 130 SERIES

- Volume I - NORTH COASTAL AREA
- Volume II - NORTHEASTERN CALIFORNIA
- Volume III - CENTRAL COASTAL AREA
- Volume IV - SAN JOAQUIN VALLEY
- Volume V - SOUTHERN CALIFORNIA

Each volume consists of the following:

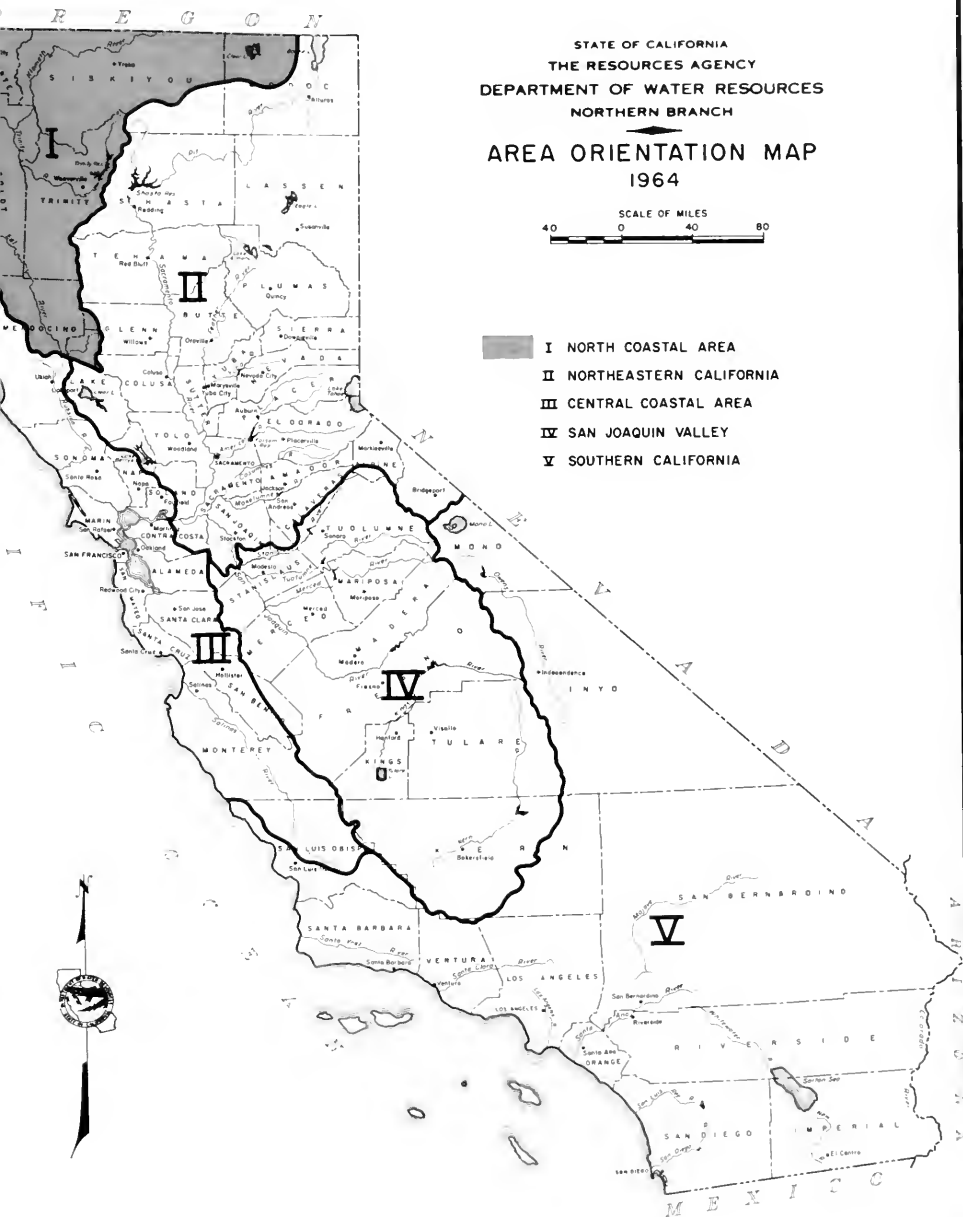

- Appendix A - CLIMATE
- Appendix B - SURFACE WATER FLOW
- Appendix C - GROUND WATER MEASUREMENTS
- Appendix D - SURFACE WATER QUALITY
- Appendix E - GROUND WATER QUALITY

DEPARTMENT OF WATER RESOURCES

BOX 388
SACRAMENTO

December 20, 1965

Honorable Edmund G. Brown, Governor,
and Members of the Legislature of
The State of California

Gentlemen:

The Bulletin No. 130 series of reports incorporates data on surface water, ground water, and climate previously published annually in Bulletin Nos. 23, 39, 65, 66, and 77. With the inauguration of this series of reports, publication of the earlier reports is suspended. This is the second in the new series of reports.

Bulletin No. 130 will be published annually in five volumes, each volume to report hydrologic data for one of five specific reporting areas of the State. The area orientation map on page iii delineates these areas.

This report is Volume I, "North Coastal Area". It includes five appendixes of detailed hydrologic data: Appendix A, "Climate", Appendix B, "Surface Water Flow", Appendix C, "Ground Water Measurements", Appendix D, "Surface Water Quality", and Appendix E, "Ground Water Quality".

The collection and publication of data such as is contained in Bulletin No. 130 is authorized by Sections 225, 226, 228, 229, 232, 345, 12609, 12616, and 12622 of the State of California's Water Code.

The basic data programs of the Department of Water Resources have been designed to supplement the activities of other agencies, in order to satisfy specific needs of this State. Bulletin No. 130 is designed to present useful, comprehensive, accurate, and timely hydrologic data to the public.

Collection of much of the data presented has been possible only because of the generous assistance of other agencies. I wish especially to acknowledge the help given by agencies whose measurements directly contributed to Bulletin No. 130-64. They include the United States Geological Survey, Forest Service, Weather Bureau, and the local County Farm Advisors of the Agricultural Extension Service, the California Department of Public Health, and the many local weather observers who have so unselfishly given of their time.

Sincerely yours,

William E. Warne
Director

INTRODUCTION

The Department of Water Resources is concerned with the development and use of water supplies, and with the methods that are employed to observe and measure hydrologic conditions. Hydrologic data are used for the planned development of new water supplies including its uses for irrigation, drainage, hydropower, flood control, navigation, recreation, and fisheries enhancement; the operation of existing projects; and other associated engineering projects. The Department's hydrologic data programs have been designed to supplement and augment other agencies' activities to fulfill the specific needs of the Department and the State.

The tabulation on page 4 presents a summary of the active hydrologic data programs in the North Coastal Area during the 1963-64 fiscal and/or water year. The table specifies the origin of the programs, program objectives, program authorizations, the type of data collected, the collection agency, the frequency of measurement or service, and the total number of stations measured during 1963-64.

Hydrographic data activities, augmented by the climate data program, supplement streamflow observations carried on by the U. S. Geological Survey.

The climatologic data collected by the Department include information on precipitation, temperature, and evaporation. Both surface flow and recharge to ground water vary in direct response to precipitation. Evaporation is an important part of the consumptive use of water and, with other climatological events, affect conditions and use of a water supply.

Ground water is the source of supply for about one-half of the water beneficially used in California. However, the use of ground water in the

North Coastal Area is less extensive than in other areas of the State. Data on the current status of the major ground water basins is collected and processed within the framework of the Department's Ground Water Measurement Program. Field measurements are made by the U. S. Geological Survey. The review, processing, and editing of the data is performed by the Department. Since only a few wells are measured in any of the monitored ground water basins, it is difficult to derive meaningful values for the average changes in water level elevations.

Water quality is a measure of the characteristics of a water supply that affect the useability of the water. As greater demand is placed on available water supplies more effective use and reuse of the State's water becomes necessary. Since quality may limit the useability of a water, knowledge of quality conditions is necessary for the most efficient use of water supplies.

The Department's climatologic and surface water measurement stations have been selected to augment the basic hydrologic networks of the U. S. Weather Bureau and U. S. Geological Survey, respectively. The current federal hydrologic data programs are, in general, not sufficient to meet the many needs of the State.

Efforts are continuously being made to improve the quality and useability of both the federal government and State's hydrologic data networks. In some instances the weather data program has been hampered by relatively inaccessible mountainous areas and an inability to obtain the services of qualified local weather observers. The ground water data programs are continuously undergoing changes to provide a more accurate picture of ground water occurrences and associated quality makeup of the waters in the various defined ground water aquifers or zones.

The future conduct of the hydrologic data programs in the North Coastal Area, particularly with respect to the water quality activities, will be to reduce the frequency of measurements at a number of stations and continue to retain the quality of data currently obtained. An increasing effort is being made to more adequately define the ground water aquifers through geologic investigations. With this increased emphasis on the differentiation between the various ground water zones, the data collected can be made more useful and meaningful.

All of the hydrologic data programs are continually undergoing changes to existing networks to improve the quality and useability of the data.

SUMMARY OF HYDROLOGIC DATA IN THE NORTH COASTAL AREA, 1963-64

Program	Origin	Purpose	Authorization	Data		
				Type Collected	Collected by	Frequency Measured : Number of Stations
Climatologic Data	1956	To maintain an inventory of historical climatological conditions to: (1) predict runoff; (2) plan and operate water projects; and (3) make all weather data available for ready use.	Sees. 228, 12609, 12616 of Water Code	Precipitation	Cooperators USWB	Daily Daily
				Storage Gages	DWR	Annually
				Storage Gages	USWB	Annually
				Temperature	Cooperators	Daily
				Evaporation	Cooperators	Daily
Surface Water Measurement	1924	To provide an inventory of data on surface water which will be readily available for: (1) forecasting streamflow; (2) planning water development projects; (3) operation of flood control and multipurpose projects; and (4) formulation of agreements on water rights without expensive litigation.	Sees. 225, 226, 228, 12609, 12616 of Water Code	Wind	USWB	Daily
				Streamflow	DWR	Serviced twice each month, measured monthly
						8
Ground Water Measurement	1929	To compile representative ground water data, so that: (1) information will be readily available for future conjunctive operations; (2) appraisal can be made of drainage and overdraft problems; (3) local interest and cooperation will be stimulated; and (4) planning to develop the potential ground water basins can be facilitated.	Sees. 225, 226, 228, 12609 of Water Code	Depth to Ground Water	USGS	Monthly
						36

Program	Origin	Purpose	Authorization	Data		
				Type Collected	Collected by	Frequency Measured : Number of or Serviced : Stations
Surface Water Quality Data	1951	To compile representative surface water quality data to: (1) determine the quality of the State's surface waters; (2) detect changes in quality and alert control agencies when adverse changes occur; (3) determine trends; (4) record and catalogue the data in a readily available form; and (5) disseminate the data and information collected.	Sec. 226, 229, 12609, 12616 of Water Code	Mineral (complete DWR ally, partial mineral remaining months)	Monthly	25
				Spectrographic (heavy metals)	Semiannually	8
				Radiological	Semiannually	23
				Bacteriological	Monthly	14
Ground Water Quality Data	1953	To compile representative ground water quality data to: (1) establish existing ground water bodies; (2) determine the quality of the State's ground waters; (3) detect changes in quality and alert control agencies when adverse changes occur; (4) determine trends; and (5) provide for organization and ready dissemination of ground water quality data.	Sec. 226, 229, 12609, 12616, of Water Code	Complete and partial mineral	DWR and local county farm advisors	Annually
				Heavy Metals	Same	Selected intervals

APPENDIX A

CLIMATE

CLIMATE

The Department of Water Resources cooperates with the U. S. Weather Bureau and local agencies in the collection of climatological data. Climatological data programs are dependent, for the most part, on the cooperation of local observers. Data from selected key stations are published by both the Department and the U. S. Weather Bureau.

The tables in this appendix include total monthly and seasonal precipitation; monthly temperatures showing maximum, average maximum, average, average minimum and minimum temperatures; evaporation data showing the total evaporation for each month of the 1963-64 fiscal year; and total annual precipitation for the 1963-64 fiscal year as measured at the storage gages in the northern part of the State (so installed because of their extreme remoteness).

Most of the stations use standard meteorological equipment. Commonly accepted procedures are employed in summing up monthly totals and computing mean values. In the preparation of the mean seasonal isohyetal map (Plate 2) the long term mean values are based on the 50-year mean period 1905-06 to 1954-55, for those stations with sufficient length of record. At other stations all available records are used in determining the mean. Station density in the North Coastal Area is adequate for making reasonable estimates of average conditions over extended areas, with the possible exception of the areas in the higher altitudes.

A description of the tables and plates included in this appendix follows:

Table A-1, "Index of Climatological Stations", contains a listing of all active climatological stations in the North Coastal Area during the 1963-64 fiscal year. The station names are arranged in alphabetical order.

Each station is given a code number which is composed of two parts -- a drainage basin designation, and an Alpha Order Number which corresponds to the alphabetical sequence of the station with respect to the other stations in that drainage basin. A sub-number of two digits is occasionally affixed to the four digit Alpha Order Number. This is necessary to provide for greater flexibility as new stations are added to the listing. The cooperator index number is used when the Alpha Order Number is in conflict with the U. S. Weather Bureau number.

Other information is also given, including the year in which the record was begun, the year the record ended and the years of missing record. The code for the county in which the station is located is shown below:

<u>County</u>	<u>Code</u>
Del Norte	08
Humboldt	12
Mendocino	23
Modoc	25
Siskiyou	47
Trinity	53

Table A-2, "Precipitation Data", contains a listing of all precipitation measurements collected in the North Coastal Area during the 1963-64 fiscal year. The listing is in alphabetical order by station name. The table includes a summary of total seasonal precipitation and lists each monthly amount for the 1963-64 fiscal year.

Table A-3, "Temperature Data", describes air temperature data collected by the Department of Water Resources in the North Coastal Area. The stations are listed in alphabetical order. A listing by drainage basin and Alpha Order Number is also given. A column titled "Season" summarizes the extreme values of temperature reported at each station and also lists the mean of the monthly values. The maximum, average maximum, average, average

minimum and minimum monthly values are given for each station, and are based on 1963-64 data.

Table A-4, "Evaporation Data", describes the data collected from all evaporation stations in the North Coastal Area. This information is used to determine loss of water by evaporation from existing and proposed water storage and conveyance facilities. The stations are listed alphabetically. The table includes a listing of drainage and Alpha Order Numbers corresponding to the station names. Total evaporation is shown for each month during the 1963-64 fiscal year.

Table A-5, "Storage Gage Precipitation Data", presents the total 1963-64 seasonal precipitation at a number of storage gages located in remote regions in the North Coastal Area.

Plate 1, "Climatological Observation Station", shows the locations of all actively reporting climatological stations in the North Coastal Area. These include the U. S. Weather Bureau stations reported in the U. S. Department of Commerce monthly publication, "Climatological Data", and many stations operated by cooperative observers. A legend on the map describes the symbols used for the various types of measuring equipment and observations made.

Plate 2, "Mean Seasonal Precipitation", shows the rainfall pattern over the North Coastal Area. Lines of equal mean seasonal precipitation are drawn to define the normal amounts. The lines represent normals based on a 50-year mean period of 1905-06 through 1954-55.

APPENDIX B
SURFACE WATER FLOW

SURFACE WATER FLOW

The Surface Water Measurement Program is a long-term, continuing, basic data activity of the Department, providing accurate measurements of water stages and corresponding streamflow discharges.

The program incorporates both field and office activities. The field activities include the installation and maintenance of gaging stations as well as the actual measurement of streamflow. The office work includes the preparation of data for computation by machine methods. This consists of developing a rating curve for each streamflow station from a series of instantaneous discharge measurements, and a related formula. Manual computation of discharge is required when the direct stage-discharge relationship has been destroyed by ice forming on the control or by backwater from a tributary or control structure downstream.

Definition of Terms

The following terms are commonly used:

Cubic foot per second is the unit rate of discharge of water. It is a measure of a cubic foot of water passing a given point in one second.

Acre-foot is the quantity of water required to cover one acre to a depth of one foot. It is equivalent to 43,560 cubic feet or 325,850 gallons.

Drainage area of a stream at a specified location is that area, measured in a horizontal plane, which is enclosed by a drainage divide.

Water year is the 12-month period from October 1 of one year through September 30 of the subsequent year and is normally designated by the calendar year in which it is terminated.

Explanation of Streamflow Tables

The data shown in Table No. B-1 have been determined from observations during the current year by Department personnel. Measurement procedures which have been employed are consistent with those used by the U. S. Geological Survey.

Accuracy of the flow records range between "excellent" (less than 5 percent error) and "good" (less than 10 percent error). The records of monthly and seasonal mean discharge and runoff are generally more accurate than the daily flow records.

When flows at a single station are in excess of 140 percent of the highest measurement on the rating curve, the computed daily mean discharges from the electronic computer are shown as "estimates". Normally, the rating is good where there is a fixed channel and flow regimen at the station. The rating varies where aquatic growth or shifting sands are present. Where the rating is not permanent more frequent measurements of discharge are necessary.

Locations of individual measurement stations are given in the tables of flow. Location numbers have been assigned in accordance with the Department's "Hydrologic Procedures Manual".

The location number is a six-digit number. The first letter designates the hydrographic area; the first number the river basin; the second number the reach of the stream. The last three numbers are sequence numbers assigned to a specific station. The sequence numbers begin at the downstream end of the reach.

The streamflow tables are arranged in a downstream order. Stations on a tributary entering between two main stem stations are listed between

those stations and in downstream order. A stream gaging station normally derives its name from the stream and the nearest post office (e.g., Weaver Creek near Douglas City).

An automatic water stage recorder is in operation at all of the Department's gaging stations in the North Coastal Area.

Following are the significant figures used in reporting streamflow data, consistent with the accuracy of measurements obtained:

- 1. Daily flow - Cubic feet per second
 - 0.0 - 9.9 Tenths
 - 10 - 99 2 Significant figures
 - 100 - above 3 Significant figures

- 2. Mean flow - Cubic feet per second
 - 0.0 - 99.9 Tenths
 - 100 - 999 3 Significant figures
 - 1000 - above 4 Significant figures

The water year totals reported to a maximum of four significant figures.

Station descriptions and historical data are provided at the bottom of each table of flow. Gage heights are in feet above assumed "local" datum planes.

The eight surface water measurement stations measured by the Department in the North Coastal Area are located on Figure B-1.

INDEX TO GAGING STATIONS

- 1 Little Shasta River near Montague
- 2 Shasta River at Edgewood
- 3 Etna Creek near Etna
- 4 Moffett Creek near Fort Jones
- 5 Browns Creek near Douglas City
- 6 Weaver Creek near Douglas City
- 7 North Fork Trinity River at Helena
- 8 Big Creek near Hayfork

INDEX TO SAMPLING STATIONS

- 1a Shasta River near Yreka
- 1b Scott River near Fort Jones
- 1c Klamath River above Hamburg Reservoir Site
- 1d Butte Creek near MacDoel
- 1e Antelope Creek near Tennant
- 1f Klamath River below Iron Gate Dam
- 2a Salmon River at Somesbar
- 2b Klamath River near Seiad Valley
- 2c Klamath River at Orleans
- 3 Klamath River near Klamath
- 3a Smith River near Crescent City
- 3b Redwood Creek at Orick
- 4 Trinity River near Hoopa
- 4a Trinity River at Lewiston
- 4b Trinity River near Burnt Ranch
- 5 Eel River near McCann
- 5a Van Duzen River near Bridgeville
- 5b Outlet Creek near Longvale
- 5c Eel River, Middle Fork at Dos Rios
- 5d Eel River near Dos Rios
- 6 Eel River at Scotia
- 6a Mad River near Arcata
- 7 Eel River, South Fork near Miranda
- 7a Mattole River near Petrolia
- 7b Bear River near Capetown

Station located 30 feet above Hayfork-Douglas City Highway bridge, 2 miles east of Hayfork. Tributary to South Fork Trinity River via Hayfork Creek. Flow influenced by upstream diversion dam of community of Hayfork. Drainage area is 27.3 square miles.

APPENDIX C
GROUND WATER MEASUREMENTS

GROUND WATER MEASUREMENTS

All studies of ground water problems, and plans for the solution of these problems, should be founded upon accurate records of ground water elevations obtained over a period of many years. This is true whether the problem is the determination of the safe yield of a ground water basin, an operation of a basin for cyclic storage in conjunction with surface water supplies, or the control of sea water intrusion.

The Department began the collection of ground water data in 1930, in conjunction with special investigations of water resources of specific areas, and has gradually developed a continuing program of basic data collection. Through cooperative activities with the federal and local agencies, coordinated and augmented by the Department, the program of ground water level measurements has gradually been expanded for adequate coverage in most basins.

Within the North Coastal Area the Department cooperated with the U. S. Geological Survey during the 1963-64 fiscal year in the systematic observation of ground water levels in nine of the more important ground water basins. The field measurements were made by the U. S. Geological Survey; whereas, the review, processing, and editing of the data was accomplished by the Department.

Wells are selected for measurement on the basis of geographical density, length of record, frequency of measurements, conformity to water level fluctuations in the basin and availability of a well log, mineral analyses and production records.

The depth to water in most of the wells is normally a direct measurement made with a tape. However, in some of the deeper wells measurements are made with an air line and gage or an electric sounder.

A summary of the average seasonal change in water levels in the nine ground water basins reported in this appendix are given in Table C-1, "Average Ground Water Level Changes in North Coastal Area Basins". The ground water level measurements collected from the North Coastal Area basins during the 1963-64 fiscal year are included in Table C-2, "Ground Water Level Measurements".

Numbering Systems

Region and Basin Designations. All data presented in this appendix is located within Region 1, a geographic area defined in Section 13040 of the Water Code. The nine ground water basins measured in the program during 1963-64 are shown on Figure C-1.

A decimal system of the form 0-00.0 is used for basin numbering. The number to the left of the dash refers to the geographic region and the first two digits of the number on the right of the dash refer to the hydrographic unit, generally designated as a basin, valley, or area. These are followed by a decimal which shows the subbasin, area, or subarea within the basin, valley, or area. Two zeros following the decimal denotes that there is no subbasin, area, or subarea. An example is given below:

1-01.00

Region (North Coastal Region)	_____	┌ ├ └
Hydrographic Unit (Smith River Plain)	_____	
Subarea (No subareas exist in the North Coastal Region)	_____	

Well Numbering System. The state well numbering system used in this report is based on the township, range, and section subdivision of the United Stated Public Land Survey. It is the system used in all ground water investigations and for numbering all wells for which data is published or filed by the Department. In this report, the number of a well assigned in accordance with this system is referred to as the State Well Number.

Within the system each section is divided into 40-acre tracts lettered as follows:

D	C	B	A
E	F	G	H
M	L	K	J
N	P	Q	R

Wells are numbered within each 40-acre tract according to the chronological sequence in which they have been assigned State Well Numbers. For example, a well which has the number 16N/1W-2J1H would be in Township 16 North, Range 1 West, Section 2, Humboldt Base and Meridian, and would be further designated as the first well assigned a State Well Number in Tract J. In this report well numbers are referenced to the Humboldt Base and Meridian (H), and the Mount Diablo Base and Meridian (M).

Agency Supplying Data. The code number assigned to the U. S. Geological Survey, the sole measuring agency for the wells listed in this appendix, is 5000.

Well Use. The use of water is indicated as follows:

<u>Code</u>	<u>Well Use</u>
(Blank)	Unknown
1	Domestic
2	Irrigation
3	Municipal
4	Industrial
5	Injection or Recharge
6	Drainage
7	Domestic and Irrigation
8	Test
9	Stock
0	Unused

Well Depth. Well depths shown were reported by the owner, obtained from a driller's log or measured at the time of the well canvass.

Reason for Questionable Measurement. If the water level measurement is of questionable reliability, the reason is indicated by the following code preceding the measurement:

<u>Code</u>	<u>Reason</u>
1	Pump operating
2	Nearby pump operating
3	Casing leaking or wet
4	Pumped recently
5	Air or pressure gage measurement
6	Other
7	Recharge operation at or near
8	Oil in casing
0	Caved or deepened

Reason for No Measurement. If no measurement was made at a well scheduled to be measured, the reason for not making the measurement is indicated by the following code:

CodeReason

1	Pump operating
2	Pump house locked
3	Tape hung up
4	Cannot get tape into casing
5	Unable to locate well
6	Well has been destroyed
7	Special
8	Casing leaking or wet
9	Temporarily inaccessible
0	Measurement discontinued

APPENDIX D
SURFACE WATER QUALITY

SURFACE WATER QUALITY

The Surface Water Quality Data Program provides basic information on the quality characteristics of the State's surface waters. Data presented in this appendix are measured values of the chemical, physical, and radiological characteristics of surface waters in the North Coastal Area, as shown on the "Area Orientation Map". The surface water quality program is performed in cooperation with other state, local, and federal agencies.

All data presented in this volume are within the North Coastal Water Pollution Control Region (No. 1) excluding the Russian River drainage basin and the area along the coast south of the Mattole River drainage. Figure B-1 in Appendix B shows the location of surface water sampling stations for the 1963-64 water year. Surface water quality samples are normally collected at or near existing stream gaging stations.

The Surface Water Quality Data Program consists of selecting locations to be sampled, collection of samples by Department personnel or cooperators, laboratory analysis by an assigned agency, examination of the data to note trends or significant changes, and publication of the data and findings.

Except where noted, tabulated values for temperature and dissolved oxygen are those measured in the field at the time of sampling. Comments on local conditions are noted in the field books but are not included in the tabulation.

Tabulated values for dissolved minerals are the analytical quantity reported in parts per million (ppm) and a computed value for equivalents per million (epm). Electrical conductivity is reported as micromhos at 25°C and temperature is in degrees Fahrenheit. Laboratory analyses of surface water

samples were performed by the U. S. Geological Survey (USGS) in accordance with "Methods for Collection and Analysis of Water Samples", Water-Supply Paper 1454. Analysis of surface water samples for trace elements was performed by spectrograph by the U. S. Geological Survey and is reported in parts per billion.

Analyses for radioactivity were made by the California Department of Public Health in Berkeley, and the results are expressed in terms of activity measured in micro-micro curies per liter (mmc/l), which is equivalent to pico-curies per liter (pc/l). The most probable error is reported with the measured value.

Bacteriologic determinations were also made by the California Department of Public Health in Berkeley, and are expressed as the most probable number (MPN) of coliform bacteria per milliliter of sample. In view of the rapidity and frequency of change in the density of coliform organisms, frequent and lengthy sampling is necessary before a truly reliable evaluation can be made.

TABLE D-1
SAMPLING STATION DATA AND INDEX
NORTH COASTAL AREA

Station	Station Number	Location ^a	Period of Record	Frequency of Sampling ^c	Sampled by ^d	Analyses on page

APPENDIX E
GROUND WATER QUALITY

GROUND WATER QUALITY

Data presented in this appendix are measured values of selected quality characteristics of ground waters in the North Coastal Area, as shown on the "Area Orientation Map". The Ground Water Quality Data Program is based on systematic sampling of a predetermined network and is reported annually by water year. The Ground Water Quality Data Program is performed in cooperation with other state, local, and federal agencies.

All data presented in this volume are within the North Coastal Water Pollution Control Region (No. 1) excluding the Russian River drainage basin and the area along the coast south of the Mattole River drainage. Wells sampled in the ground water quality program are arranged by basin and tabulated in sequence by township, range, and section. The eight ground water basins sampled annually in the North Coastal Area are shown on Figure C-1 in Appendix C.

The Ground Water Quality Data Program consists of selecting locations to be sampled, collection of samples by Department personnel or cooperators, laboratory analysis by an assigned agency, examination of the data to note trends or significant changes, and publication of the data and findings.

Except where noted, tabulated values for temperature are those measured in the field at the time of sampling. Comments on local conditions are noted in the field books but are not included in the tabulation.

Tabulated values for dissolved minerals are the analytical quantity reported in milligrams per liter (mpl) and a computed value for equivalents per million (epm). Electrical conductivity is reported as micromhos at 25°C and temperature is in degrees Fahrenheit. Laboratory analyses of ground waters were performed in the Department's Chemical Laboratory at Bryte, in accordance

with "Standard Methods for the Examination of Water and Waste Water", Eleventh Edition, or by the U. S. Geological Survey (USGS). The methods yield comparable accuracy of analysis. The determination of trace elements was performed by the "wet" analysis at the Bryte Laboratory. The results are reported in parts per billion. During 1963-64 the ground waters of Butte Valley were the only North Coastal Area ground waters analyzed for trace elements.

Well Numbering System

The state well numbering system used in this report is based on the township, range, and section subdivision of the United States Public Land Survey. It is the system used in all ground water investigations and for numbering all wells for which data are published or filed by the Department of Water Resources. In this report the number of a well, assigned in accordance with this system, is referred to as the State Well Number and is described in more detail in Appendix C of this bulletin.
